Incorporation of Balance and Vestibular Exercises in a 45-year-old Female with Bell’s Palsy: A Case Report.

Kelsey Andersson, SPT and Erica Kiernan, PT, DPT, OTR/L, MOT

**PURPOSE:**
Bell’s palsy is an acute neuropathic disorder affecting the facial nerve, causing unilateral weakness or full paralysis of facial muscles. Most individuals will have complete spontaneous recovery within three to four months following initial onset, but approximately 30% of individuals will continue to have permanent dysfunction of muscle control. Individuals can also present with vestibulocochlear nerve involvement, causing unilateral vestibular hypofunction. Current studies are starting to show the benefits of facial strengthening exercises to decrease the risk of permanent facial nerve dysfunction, but no current research describes the benefits of incorporating vestibular rehabilitation exercises.

The purpose of this case report is to determine the effectiveness of balance and vestibular exercises in conjunction with facial strengthening exercises on a patient with Bell’s palsy.

**CASE DESCRIPTION:**

Bell’s palsy is an acute neuropathic disorder affecting the facial nerve, causing unilateral weakness or full paralysis of facial muscles. Most individuals will have complete spontaneous recovery within three to four months following initial onset, but approximately 30% of individuals will continue to have permanent dysfunction of muscle control. Individuals can also present with vestibulocochlear nerve involvement, causing unilateral vestibular hypofunction. Current studies are starting to show the benefits of facial strengthening exercises to decrease the risk of permanent facial nerve dysfunction, but no current research describes the benefits of incorporating vestibular rehabilitation exercises.

The purpose of this case report is to determine the effectiveness of balance and vestibular exercises in conjunction with facial strengthening exercises on a patient with Bell’s palsy.

**METHODS:**

- **Initial Evaluation**
  - HEP consisting of active and active-assisted eyebrow raises, nose wrinkling, lip depression, lip elevation, eye closing, frowning and producing a wide smile.

- **Treatment 1**
  - AAROM/AROM facial muscles
  - VOR x1 and VOR x2
  - Tandem stance on even surface
  - Balance on foam mat

- **Treatment 2**
  - AAROM/AROM facial muscles
  - VOR x1 and VOR x2 at increased reps
  - Tandem stance on even surface, eyes closed
  - Balance on foam mat w/ min-mod perturbations
  - Tandem stance with VOR x1

- **Treatment 3**
  - AAROM/AROM facial muscles
  - VOR x1 and VOR x2 at alternating speeds
  - Single leg stance on foam mat
  - Tandem stance on foam mat w/ VOR x1 and VOR x2

- **Treatment 4**
  - AAROM/AROM facial muscles
  - Resisted eye closure and buccinator mobility
  - VOR x1 and VOR x2 at alternating speeds
  - Single leg stance on foam mat
  - Tandem stance on foam mat w/ VOR x1 and VOR x2

- **Facial Disability Index (FDI)**: Initial: 44/100 social; 64/100 physical
  - 4th visit: 50/100 social; 48/100 physical
- **MMT**: Orbicularis oculi and buccinator improved from weak functional to functional. All other facial muscles stayed at same rating.

By incorporating vestibular exercises into the patient’s therapy sessions, she was able to demonstrate improved single leg stance and self-reported decrease in onset of symptoms with a progression of vestibular exercises. Facial muscle strengthening exercises demonstrated significant improvements in eye closure and smiling, but she exhibited little changes in facial symmetry, strength and self-perceived function. The patient reported she was starting to drive and participate in more social events by the 4th treatment session.

**CONCLUSION:**

By incorporating vestibular exercises into the patient’s therapy sessions, she was able to demonstrate improved single leg stance and self-reported decrease in onset of symptoms with a progression of vestibular exercises. Facial muscle strengthening exercises demonstrated significant improvements in eye closure and smiling, but she exhibited little changes in facial symmetry, strength and self-perceived function. The patient reported she was starting to drive and participate in more social events by the 4th treatment session.
